13	2025-07-09	Max	Alex	all other		Felix	Felix	
14	2025-07-16			all other		Felix	Felix	Demo day!
Product owners, software developers, and Scurm Master are set and ideally don't change over time; the critical part is the Release Manager role you need to define here								

Goals	Interpersonal relationship objectives: “To foster an atmosphere of mutual respect and learning, creating a team-spirit”
	Main goal is to create a satisfiying project that makes Us, the IP(Industry Partner) and open-source community happy
Meeting norms	Documentation in english and meeting language in German
	Start on time
	Be Polite
	Purpose: Clearly define the goal of the meeting. Preparation: Ensure all participants are well-informed and ready to contribute. Participation: Encourage active engagement from all attendees. Process: Organize the meeting structure and agenda effectively. Progress: Monitor the meeting's progress and ensure it stays on track.
Working norms	Leave the code better than you found it (The Boy Scout Rule)
	Keep it Simple, Stupid (KISS)
Coordination norms	Felix will do the retros + keeping track of meetings
	Alex and Max will take care of the assignments (Backlog Items)
Communication norms	We check Discord at least every day
Consideration norms	Communicate Conflict in Team-Meeting. Help from Felix or Jovana to solve conflicts.
	Respect, active listening, tolerance
Cont. improvement norms	Experimentation spirit and feedback culture
	Burn-Down charts as process tracking
Rewards	Appreciation and praise
Sanctions	Wear the ducky tie
	Post a cute/funny pic of a pet (or similar)
Signatures	
Scrum Master	Felix Lang
Product owner	Maximilian Krug
Product owner	Alexander Lorenz
Software developer	Mohammad Moaiad Alhamdh Alsultan (Moaiad Alsultan)
Software developer	Jonas Brüggemann
Software developer	Lennard Clicqué
Software developer	Biranavan Parameswaran (Biri)
Software developer	Lisabeth Hasse
Software developer	Tessa Heidkamp
Software developer	Aditi Vishwas Takale

Product Vision	Project Mission
Product Vision We are transforming the landscape of software testing through intelligent, AI-powered automation. Our vision is a future where testing is no longer a bottleneck but a seamless, continuous, and reliable part of the development process. By empowering developers and testers with AI tools that autonomously generate and maintain test cases, we free them from generating the same test cases over and over to instead focus on creative problem-solving and strategic innovation. Our solution supports a future of scalable, secure, and locally controlled quality assurance, driving the next evolution in software development. We invision the role of the programmer to become a curator and innovator of AI generated Code.	Product Mission Deliver a minimum viable product (MVP) of an AI-powered test generation assistant that interacts effectively with real-world software projects. This includes laying the empirical and research groundwork for the idea. From this research we will conclude a MVP, that can analyze simple Python and C++ programs and produce corresponding test cases. Operated through a user-friendly chat interface. The MVP will showcase initial integration with widely used open-source testing frameworks such as Robot Framework, proving the viability of AI-assisted test automation in practical, everyday development environments.

Term	Definition
LLM	Large language model
LLM Input	User Input into the LLM
LLM Output	Response of the LLM to the Input
LLM System Prompt	System message sent (this is different from the LLM Input)
Temperature	gradient how "creative" the LLM behaves
Interface Script/ LLM factory	Backbone script of the project to start, end and use the LLM containers
Container	Docker container, (not kaniko os something else)
IP	Industry Partner
Sprint	agile (Amos) sprint with a duration of 2 weeks
CI	GitHub workflows as Continuouse Integration assistent
Wiki	Documentation in the Github repos wiki (not Wikipedia)
Laptop	Personal device to run the code (nothing fancy standard device) TODO add specs

Sprint #	Sprint goal
1	None
2	None
3	None
4	Laying foundational architecture groundwork
5	Initalize future development area
6	Enhance user value by metricization
7	Preparing for Midproject review
8	Expanding Modularity and advancing metricization
9	Enhancing accuracy of LLM return
10	Advancing Usability and LLM response rsatistics
11	Design and Development for own LLM
12	Create CI Usecase and user value
13	Prepare for demo day
14	Last touches before the finally
15	-/- (only winter term)

Features						
7						
		Unify requirements.txt files	2			
		Frontend: Display LLM result in Textbox	5			
		Onboard small model 1b	2			
		Prune models for only MIT license Models	2			
		Unify payload to Json	5			
		Module: Evaluate LLM performance	5			
		Module: Implement System property findings	5			
		Add multiple payload APIs	5			
8						
		Onboard and Test new LLM	3			
		Module: Add security analyzer module for generated code	3			
		Module: Add configurable timeouts for LLM generation	3			
		Module: Code Complexity: Complexity Measurement Tool (CMT)	5			
		Module: Code Complexity: CM	5			
		Frontend: make modules togglable in UI	5			
		Module: Detect redundant/duplicate test cases	3			
		Output exporter (as zip, json, http etc..)	3			
9						
		Research: test readability score (Flesch/Kincaid)	3			
		Module: Detect Edgecase accuracy of LLM research	5			
		Onboard and Test new LLM	3			
		Module: Map language to optimal model with fallback support	3			

Sprint	Goal	Feature Name	Est. size	Est. remaining	Real size	Real remaining
		Module: Allow chaining outputs between models	3			
		Research: Befits of chaining methods	2			
		Use metrics to compare 1b, 3b, 7b and maybe 14b models	2			
		Research: How to measure code coverage with tools	5			
10						
		Onboard and Test new LLM	3			
		Module: Measure test readability score (Flesch/Kincaid)	5			
		Module: Check output for code coverage of the tests	3			
		Module: Flaky Test Identifier: Detect and flag non-deterministic/generated tests	5			
		Module: Show dependency hierarchy of code by logic flow	3			
		Try HPC to run the thing and test a larger model 50b+ parameters	5			
		Module: Auto-split large files into units for test generation	3			
		Research: how to train/ enhance own LLM on HPC	3			
11						
		Onboard and Test new LLM	3			
		Use HPC to train our own LLM	5			
		Module: Auto-group similar test cases into suites	5			
		Clean the repo	2			
		Module: LLM testing of Code understandability, make LLM describe the code, let the same LLM (with no history) build the code from the description -> see if code passes the Unit tests.	5			
		Test current models for output consistency (deterministic)	3			
		Frontend: Diff viewer between original and tested source	5			
12						
		Research: different types of software test	3			
		CI: create Docker CI for running everything in CI	2			
		Research: can we run the models in the CI	3			
		Eveluate the performance of the models with and without the modules	3			
		Placeholder	15			
13						
		Ci: Create a CI flow that creates the uni tests and provides them as unit tests	5			
		Improve Usability of the frontend	5			
		Prepare Demo and create 3 Usecases	2			
		Clean the wiki	2			
		Overwork the Bill of Materials	1			
		Overwork the Architectuer Document	3			
		Refactor the Code	3			
		Placeholder	10			
14						
		Clean the repo	2
